Acknowledgements

The study was prepared by Harbridge House, Inc. under the direction of Dr. John R. Dinkelspiel. George Lechter was responsible for the computer modeling, and Ann Damsgaard assembled the basic data, assisted by Beverly Patton.

Assistance in gathering data from School Department records and interpreting these data was provided by Dr. Louis Perullo, Director of Management Information. Dr. James Breeden and Dr. Perullo provided policy guidance for the study, and Dr. Breeden, Mr. Joseph Bishop of the state Department of Education, and Mr. Peter Scarpignato of the city Public Facilities Commission were the sponsoring parties.

I. Introduction

The projections of school enrollments in Boston's public and non-public school presented in this report were developed as part of the Unified Facilities Plan ordered by the Federal District Court. The projections were prepared by Harbridge House, Inc., under contract with the Boston Public Facilities Commission, on behalf of the Boston School Department, the State Department of Education, and the Public Facilities Commission. All three agencies are parties to the court ordered plan.

The projections presented here represent a complete revision and substantial expansion of similar projections developed for the same agencies in June, 1977. The current projections are based on substantially improved enrollment data available from the Boston School Department and on improved methodologies. In consequence, the data, particularly at the district level, are significantly more reliable than the earlier projections. In addition, projections for actual (as opposed to assigned) enrollments, for bilingual student enrollments and for special needs student enrollments are presented for the first time.

Enrollment projections are also presented for non-public schools, that is, parochial and private schools. To facilitate comparison, these projections are aggregated within the same district boundaries as the public schools.

II. Findings

A. Citywide Enrollment Trends

The steep enrollment decline in the Boston public schools is continuing. Over the next five years enrollments are projected to decline by 18,207, or 25.2%. From the current (1978-79) level of 72,358, enrollments are projected to fall to 54,151 in 1983-84. These figures are shown in Table I-1

This steep decline continues the pattern noted in previous projections.¹ From a high of 96,247 students in 1970-71, the Boston public schools will have lost over 42,000 students in the thirteen year period to 1983-84 -- almost 44%. Over the last five years of this period, 1973-74 through 1978-79, enrollments have declined by 19,892, or 21.6%. The annual rate of decline has been steeper since the 1974-75 school year than it was in the preceding years.

At the same time, enrollments in Boston's non-public (parochial and private) schools have been declining somewhat less sharply. From a 1978-79 level of 24,381, enrollments in non-public schools are projected to fall to 20,218 in 1983-84, a decline of 17.1%. These figures are shown in Table V-1. This moderating rate of projected loss as compared to the public schools contrasts with

notably steeper rate of decline in non-public schools in earlier years. For instance, from 1968 to 1976 non-public school enrollments fell 27.0% as compared to a loss of 18.7% for public schools.

Common to the decline in both public and non-public school enrollments is the rapid decline in births in Boston. Since 1965 (when the students who will be seniors in 1983 were born), annual births in Boston have fallen from 13,112 to 6,996 in 1977. This is a decline of 46.6%. (See Exhibit 1)

Because many factors, like migration and changing school preferences, account for enrollment changes, it is not possible to be precise about the impact of the birth decline on actual public school enrollments. The following, however, provides a point of comparison. In the period during which 1983's seniors will be moving through the schools (1971-1983, excluding kindergarten) enrollments are projected to drop 43.7%. During the twelve year period following the birth year of that senior class (1965-1977) births dropped, as noted, 46.6%. The rate of decline of births is thus roughly parallel to the rate of decline of enrollments during comparable periods.

It should be emphasized that this comparison does not explain all the causes of enrollment declines. A variety of causes of fewer children attending Boston schools have been identified, if not always well documented. For instance, recent estimates by federal Census Bureau experts show Boston to be almost unique among larger, older cities in experiencing a continually growing rate of out-migration.² This is likely to be a significant long-run factor in declining enrollments. The full causes of enrollment declines -- from the desegregation order, to the changing popularity of the type of education provided in parochial schools, to changing urban demographic patterns, to "white flight" -- have yet to be explained. It seems clear, nonetheless, that the sharply declining birth rate has played a major role in falling school enrollments in Boston.

The projected enrollment decline does not affect equally all levels of the public school system. Past fluctuations in the size of entering classes, changes in feeder school patterns caused by past shifts in district lines, school closings and openings, and changing family decisions about enrollment in public or non-public schools -- these and other factors have created variations in the size of the age cohorts moving through the schools. Figures in Tables I-2 through I-10 display these differential effects. Elementary school enrollments are projected to drop 30.1% by 1983 from the 1978-79 level, and middle schools 31.4%. High schools, however, are projected to decrease only 16.0%.

The foregoing analysis of enrollment trends has been based on assigned enrollments, that is, on the number of students assigned to each of the city's public schools as of October 1 of each year. In practice, many of the

of Public Health; Harbridge House, Inc.

students do not attend their assigned schools for a variety of reasons, ranging from moving out of the city to transferring to another school.

Tables IV-1 through IV-10 present enrollment projections based on actual enrollments. (Actual enrollments are defined as assigned enrollments less "Did Not Report" -- DNR). Citywide, actual enrollments are projected to be lower than assigned enrollments by 7.5 - 8.0%. The variations in different grades, however, are substantial. In the elementary schools after first grade, DNR's tend to be 2 - 3%. In the middle schools they tend to rise to the 3-5% range. In the ninth grade, however, there is a sharp drop, with about a 20% difference between assigned and actual enrollments. In some districts, the drop at the ninth grade level is as large as 35% or more. The annual "loss" of assigned students continues through tenth and eleventh grades at a slightly lower level, but largely disappears in the twelfth grade.

While the School Department has recently maintained detailed records of DNR's, these have not yet been analyzed on an aggregate basis to determine the pattern of reasons for this "loss" of students. Since the proportion of students who "did not report" varies widely across grades and districts, it seems likely that the pattern of reasons will vary widely as well. It is clear, nonetheless, that the transition from elementary to middle schools and from middle to high schools is significantly associated with these losses.

The projections of actual enrollments are based on a statistical analysis of past enrollments. Specifically, actual enrollments are projected separately for each grade and district based on the average percentage of DNR's compared to assigned enrollments in that grade and district over the last three years (1976-1978).

B. Longer Range Trends

Projections beyond 1983-84 are beyond the scope of this report. Some general observations are possible, however. The number of births in Boston is probably at its lowest level now. In 1976 there were 7,098 births, and in 1977, 6,996. In 1978 the figure will probably be a little over 7,000. The stability of these numbers may be compared with the earlier sharp declines shown in Exhibit 1.

Projections of the number of births after 1978 are largely a function of the number of fertile women (ages 15-44) in Boston and their fertility rate, that is, the number of children born per thousand women age 15-44. According to population estimates prepared by the Office of State Health Planning, the number of women aged 15-44 is projected to increase slowly (less than 1% annually) over the next several years.³ The future fertility rate, on the other hand, is a subject of considerable speculation. There are some indications that the steep decline of

recent years is leveling off.⁴ The slow increase in the number of women 15-44, plus a stabilizing fertility rate, will likely translate into a gradual increase in births in Boston.

If the number of births in Boston is indeed on the increase again, even if only gradually, then the school age population may stabilize in the late 1980's or early 1990's. Whether this in turn will be reflected directly in public school enrollments depends in part on the future attractiveness of parochial and private schools as alternatives to the public school system, and in part on the net outmigration from the city of families with children.

C. District and Program Enrollment Trends

District level projections are of significantly better quality in the current study than they were in the previous study. This results in part from a substantially improved data base available from the School Department. Because some of the principal users of these data will be the District Planning Groups as they participate in the unified facilities planning process, this improvement in the reliability of the projections should have a measurable impact on the quality of long-term planning.

Variations among districts in future enrollment trends, as shown in Tables I-2 through I-10, are substantial. The projected decline in enrollments from 1978 to 1983 ranges from 19.2% in District 7 to 35.6% in District 3. These declines compare with the citywide average of 25.2%. Within districts at the level of elementary, middle and high schools, the pattern of variation is somewhat different. Declines in the elementary schools tend to be fairly uniform among all districts, within a range of 2 - 3% over the five year period. In the middle schools, however, the declines range from 20.5% in District 7 to 46.7% in District 3. The range in the high schools is even greater.

The range of variation by district among school levels is largely a reflection of the varying pattern of attendance at District 9 schools. In District 8, for instance, the proportion of students going to magnet schools at the high school level averages about 22%. In District 2, however, the average magnet school attendance for high school children is about 58%. Such large differences in magnet school attendance patterns of course have proportionate impacts on attendance at the sending schools.

In order to project the number of children attending magnet schools, some assumption about the proportion of children in each district and grade who would choose to go to magnet schools rather than to district schools was required. The assumption used in this study -- supplied by the School Department -- was that the proportion of children being sent to magnet schools by each district in 1978-79

would remain constant in future years. While this assumption is unlikely to prove true in fact, School Department policies regarding future magnet school programs are not yet formulated in such a way as to permit a qualitatively better assumption.

To the extent to which magnet school attendance patterns differ from those assumed here, therefore, attendance at district schools, principally at the middle and high school levels, will also vary from those projected here. Changes in future magnet school attendance patterns will not affect citywide enrollment projections, since they represent only inter-district transfers and not changes in total school enrollments. They may, however, cause significant changes in the district middle school and high school enrollment projections from those presented here.

Projections for enrollments in bilingual and special needs programs are presented in Tables II-1 through II-10, and III-1 through III-10, respectively. These projections have been developed primarily to assist planners at the district level. They do not represent a substantive analysis of the likely size of these student groups in the future. For instance, no separate analysis of the numbers of non-English speaking children coming into the city or into the public schools has been made. The projections in this study are based on an assumption, provided by the School Department, that the ratio of special needs and bilingual students to assigned enrollments in each grade and district in 1978-79 would remain the same through 1983-84.

Clearly there will be changes in demographic and student enrollment patterns among bilingual students and in program policies affecting special needs students that will change enrollments in these programs from current levels. Neither the data nor the policies which would permit quantification of these changes are presently available, however. Thus the numbers presented here are to be seen more as planning aids than as bona fide enrollment projections of changes in the size of these two student populations.

D. Non-public School Enrollments

The projected rate of decline of non-public school enrollments is less steep than that projected for the public schools. As shown by the figures in Table V-1, non-public school enrollments are projected to decrease by 17.1% between 1978-79 and 1983-84. This compares with a drop of 25.2% in the same period in the public schools, and a drop of only 7.7% in the previous five years (1973-1978) in the non-public schools.

District level data presented in Tables V-2 through V-10 are significantly less reliable than the citywide total for non-public schools because non-public schools are not organized along the district lines of the public school

system. Individual non-public school data have been aggregated on a district basis to facilitate the task of district level planners. The non-public school category includes both parochial schools (80-90% of the total) and other private schools. Thus the non-public school data for a particular district have only a statistical reality, and do not reflect actual relationships among these schools. The artificiality of these district level data, therefore, reduces the reliability of the district level projections.

E. Accuracy of Projections

The projections of assigned citywide enrollments were subjected to standard statistical measures of reliability. These measures show that 50% of the projected figures will fall within the following ranges:

1979-80 \pm 2.54%

1980-81 \pm 2.95%

1981-82 \pm 3.41%

1982-83 \pm 3.90%

1983-84 \pm 4.39%

Because of improved data and methodologies, this predicted accuracy is substantially better than that of previous projections for which 25% of the projected figures fell within roughly the same ranges.

District projections were subjected to an additional test. The sum of the projections done individually for the nine districts was compared to projections based on a single citywide total. The latter projections should be more accurate because they were derived from a larger data set. A comparison of the annual projections derived from these two approaches shows an average annual difference of 1.6%.

III. Recommendations

The methodology used in this study has the characteristic that data deficiencies can be identified through successive iterations and then corrected, thus improving the quality of the results. The reliability of the projections in this study, for instance, have been improved significantly compared to those in the previous study in part by improvements in the earlier data base. The School Department will have the capability to make projections in the future using the computer techniques and data bases acquired through this study. Future iterations of this model by the Department should, therefore, aid in improving the quality of the data base, and thus of the enrollment projections.

There are in addition, however, some important extensions of the data bases which are required if weaknesses in the current projections are to be eliminated. Our recommendations identify the steps needed to eliminate these weaknesses.

1. Census of School Age Children

There are a number of legal and management reasons for the School Department to make each year an accurate and complete count of children aged 3-21. If an improved school census is undertaken, it would be in response to these reasons. In addition, however, the pattern of school going in Boston is such that the absence of this count also weakens the reliability of longer range enrollment projections.

The problem stems from the large portion of children attending non-public schools. The most appropriate starting place for enrollment projections is the total number of children of school going age (3-21) living in the city. In jurisdictions where almost all children go to public schools, the absence of a school age census is not as serious a problem in making projections. In Boston, however, almost one-quarter of the children attend non-public schools, and so the number of children attending public schools is a function of both the population of school age children and the attractiveness of the non-public schools.

In terms of making enrollment projections this means that there is an interdependence between future enrollments in both systems: in principle losses to one system must show up as gains to the other system. But if the total number of children available to attend school is not known, then this interaction cannot be modeled. The result is that enrollment projections must be modeled independently for the public and for the non-public systems, as was done in this study.

On a short term basis, perhaps 3 years -- assuming that school going preferences do not change suddenly during this time, the resulting projections will be fairly reliable, even in the absence of a census. But if the attractiveness of parochial schools in Boston increases suddenly again, as it did during the height of the intergration crisis, then the accuracy of the projections will be diminished considerably. In other words, not knowing how many school age children there are in Boston in total makes it harder to know if the relative proportions of children in public and parochial schools are reliable.

The availability of an accurate and complete school age census would thus contribute significantly to the reliability of enrollment projections. We recommend, therefore, that the School Department conduct a complete and accurate annual census of school age children.

2. Bilingual and Special Needs Student Populations

The special support and instructional needs of bilingual and special needs students make it particularly desirable that more accurate projections of these populations be developed. The projections presented in this study for these populations were produced, as noted, by using the assumption that the proportion of these groups in the total student population would remain constant. While this is clearly not correct, data to provide a better assumption are not now available.

The number of students requiring bilingual instruction is largely a function of immigration rates of non-english speaking city residents. Systematic efforts to calculate these immigration rates have not been undertaken. As noted in the "Recommendations" of our 1977 report, a logical place to start such an analysis is with the Hispanic speaking population, who contribute the largest number of children to the bilingual program.

The 1980 federal census is unlikely to fill this data void satisfactorily. First, because this level of detail (age and primary language) is not likely to be available before 1982. Second, because the information by nature changes rapidly. An accurate annual school age census would help in solving this problem. In the absence of this census, however, we recommend that the School Department develop techniques for estimating the rate of change of bilingual student populations. These estimating techniques will probably depend on developing close working relationships with each of the major language communities.

Studies estimating the incidence of various types of learning handicaps in the national population are available. While improving the accuracy of these studies as they apply to Boston is a worthwhile undertaking, the chief factor governing the number of special needs students actually served by the public schools is probably the manner in which the program itself is administered by the School Department. Thus, more accurate projections of the special needs population is primarily dependent on a fuller specification of the School Department's longer range policies in this area.

3. Parochial School Attendance

The interrelationship between public and non-public school going, as noted above, is important in making good enrollment projections. By far the largest part of the non-public "system" is the parochial schools. The pattern of parochial school attendance, both nationally and in Boston, has been undergoing fairly rapid and significant changes in recent years. The past is not, therefore, as reliable a guide to the future as one would like for making projections.

The Archdiocese is currently undertaking its own study of future enrollment trends in its schools. We believe that greatly increased cooperation at the working level between the public and the parochial school systems could contribute to better knowledge on both sides. We recommend that the School Department initiate such a cooperative effort.

Five Year
Boston School Enrollment Projections
1978-79 through 1983-84

Supplement

1 July 1979

This supplement to the Harbridge House report on school enrollment projections contains additional detailed and technical data. These data are intended for the internal use of the School Department.

An "Explanatory Key" is provided to assist in understanding the format in which these data are presented.

Explanatory Key: Supplementary School Enrollment
Projection Data

Assigned Enrollments -- Public Schools

Basic data shown are 10 years of enrollments by grade.

- The first bloc of five lines (1974, 1975...1978) are historical enrollment and birth data.
- The second bloc of five lines (1979...1983) are projected enrollments, and actual births.
- The years shown in the first column are school years, and are to be read as follows:

1974 = school year 1974-75

1975 = school year 1975-76

etc.

- The numbers shown in the second column are actual births, citywide, for the year six years earlier than that shown. For instance, for the line labeled 1974 (which is the 1974-75 school year) the births shown are those for 1968. (The reason for the six year interval is explained below under "Ratios.")
- The numbers shown in the column headings, K, 1, 2..., are grades.
- The last column shows the total enrollment in that district for all grades for the indicated school year.
- Citywide totals are shown after the data for all nine districts are presented. These figures, labeled "Run Total," are the sum of the previously calculated data for the nine districts, and thus no separate survival ratios were calculated.

Ratios

- The third bloc of five lines shows the cohort survival ratios for the five years of historical enrollments. These

ratios express the relationship between the number of children in a class one year and the number in that same class the following year in the next higher grade. Thus the survival ratio between a fourth grade class of 200 and the fifth grade class of 180 the following years is .900. A ratio greater than 1.0 indicates that students were added to a class in excess of those who left.

- The years shown in the first column, e.g. 1974-75, refer to two successive school years, in this case school year 1974-75 and school year 1975-76. The ratios in the 1974-75 line thus represent the "survival" of students from the 1974-75 school year into 1975-76.
- Ratios are calculated to the next grade, e.g. fifth grade to sixth grade, with two exceptions. A survival ratio was calculated from birth to first grade, because this relationship is more stable than the birth to kindergarten ratio. Kindergarten ratios were calculated "backward," from first grade to kindergarten.
- The "average for survival ratios" is the numerical average of the preceding four complete years' ratios. This average ratio is the basis of subsequent projections.
- The 1978-79 line is blank except for the birth-to-first grade column, since this would represent the relationship between the current year and next year's (1979-80) enrollment. The B-1 column figure is needed to project a kindergarten enrollment in 1983-84.

Magnet Schools

- The "magnet school contribution ratio" is the percentage of children in a particular grade being sent by that district to the District 9 schools. Thus .247 in the third grade column means that 24.7% of all third grade children attending public schools from that district are attending District 9 schools.

Actual Enrollments

- No historical data for actual enrollments are presented. The five lines of data shown are projections.

- The "Actual/Assigned Ratio" is the average of the three preceeding years' (1976-1978) actual enrollments to assigned enrollments, by grade and district. The projections of actual enrollments shown were produced by multiplying this ratio by the projected assigned enrollments for each year and grade.

Bilingual and Special Needs

- No historical data for actual enrollments are presented. The five lines of data shown are projections.
- The "Number/Assigned Ratio" is the percentage of bilingual or special needs students in each grade and district for the current (1978-79) school year. Projections for future enrollments of these two groups were produced by multiplying this ratio by the projected assigned enrollments for each year and grade.

Assigned Enrollments -- Non-Public Schools

- These projections are equivalent to the assigned enrollments for the public schools. They are based on enrollment data for individual private and parochial schools, as aggregated by Harbridge House into the public school districts. For districts showing no projections in the upper grades, there are no non-public schools within that district serving students in those grades.
- The survival ratios were calculated and are displayed in a manner similar to the equivalent data for public schools.

Boston School Enrollment Projections

1979-80 through 1983-84
